

1 Navigate to your project

Move to the project folder and check location

```
1 cd holowebbsite
2 pwd
```

holowebbsite

- Go into the project folder
- Show the full path

2 Create your files

Create the website files

```
3 touch index.html
4 touch stylesheet.css
5 touch javascript.js
6 ls
```

index.html

stylesheet.css

javascript.js

- Create HTML, CSS and JavaScript files
- List files in the folder

3 Initialize Git

Turn the folder into a Git repository

```
7 git init
8 ls -a
```

.git/

- Initialize a Git repository
- Show hidden files (see .git)

4 Check status (untracked)

See what Git sees

```
9 git status
```

Untracked files:
index.html
stylesheet.css
javascript.js

- Shows which files are not tracked
- Red text = not yet in staging

5 Add files to staging

Choose what to include in the next commit

```
10 git add index.html
11 git add stylesheet.css
12 git add javascript.js
13 git status
```

- Add files to staging (one by one)
- Check that files are ready
- Green text = staged

6 First commit

Save your first version locally

```
14 git commit -m "initial commit"
15 git status
16 git log --oneline
```

a1b2c3d initial commit

- Create your first commit
- Check that working tree is clean
- View commit history (short format)

7 Connect to GitHub

Link your local repo to GitHub

```
17 git remote add origin
https://github.com/RazuPa/holowebbsite.git
18 git remote -v
```

- Connect local repo to GitHub
- Verify the remote address

8 Fix remote (if needed)

Correct the remote address

```
19 git remote set-url origin
https://github.com/RazuPa/holowebbsite.git
20 git remote -v
```

- Update remote address
- Check that it's correct

9 Pull and merge

Get GitHub history and merge

```
21 git pull --no-rebase origin main
--allow-unrelated-histories
```

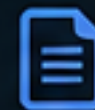

- Fetch and merge GitHub history
- Needed when local and remote were created separately

10 Handle Vim (if opened)

Save and close merge message

```
22 Esc
23 :wq
```

- Esc = leave INSERT mode
- :wq = write (save) and quit

11 Check merge result

Verify that everything is merged

```
24 git status
25 git log --oneline --graph --all
```

- Check that merge was successful
- View combined history as a graph

12 Install GitHub CLI

Install and verify GitHub CLI

```
26 gh --version
27 brew install gh
28 gh --version
```

brew

- Check if GitHub CLI is installed
- Install via Homebrew (Mac)
- Verify installation

13 Log in to GitHub

Authenticate with GitHub CLI

```
29 gh auth login
```

Follow the prompts:

```
30 GitHub.com
31 HTTPS
32 Y (yes)
33 Login with a web browser
34 Press Enter
```

- Start GitHub login in Terminal
- Follow the options as shown

14 First push to GitHub

Send your code to GitHub

```
35 git push -u origin main
```

- Push local main to GitHub
- Set upstream tracking (-u)

15 Verify push

Check if everything is up to date

```
36 git push
```

Everything up-to-date

- Used for future pushes (after upstream is set)

16 Open in VS Code

Start coding

```
37 code .
```

- Open the project in VS Code
- Edit your HTML, CSS, JavaScript files

17 Make changes

Edit your files in VS Code

```
holowebbsite/
├── index.html
├── stylesheet.css
└── javascript.js
```

- Make changes to your website
- Save files (Cmd + S)

18 Stage your changes

Add modified files to staging

```
38 git status
39 git add index.html
stylesheet.css javascript.js
40 git status
```

- See what has changed
- Add the three web files to staging
- Confirm they are ready

19 Commit your changes

Save a new version locally

```
41 git commit -m "Add first
website version"
```

- Create a new commit with message
- Saves your changes in local history

20 Push changes to GitHub

Send the new version to GitHub

```
42 git push
```

- Push your commit to GitHub
- Your website is now updated online

21 Check status

Verify that everything is clean

```
43 git status
```

Working tree clean

- Confirms everything is up to date

22 View history

See all your commits

```
44 git log --oneline
```

```
4e865f2 Add first website version
1312501 initial commit
```

- View your commit history

23 Check remote (optional)

Verify connection

```
45 git remote -v
```

```
origin https://github.com/
RazuPa/holowebbsite.git (fetch)
origin https://github.com/
RazuPa/holowebbsite.git (push)
```

- Check your GitHub remote

24 You're all set!

Your website is on GitHub

- Files created
- Git initialized
- Connected to GitHub
- Authenticated
- Code committed
- Pushed to GitHub
- Ready for future updates!

25 Normal workflow (after setup)

The daily routine when working on your project

```
1 Edit files      2 git status      3 git add .      4 git status      5 git commit -m "..."/>
In VS Code      See what changed Stage all changes Confirm staging Save a new version
(Cmd + S)
```

```
6 git push
Send to GitHub
```

Repeat whenever you make changes

26 Project structure

Your folder after setup

```
holowebbsite/
├── .git/ (hidden)
├── index.html
├── stylesheet.css
├── javascript.js
└── .vscode/ (optional)
```

27 Key

Color meaning in git status

- Red = not tracked or modified
- Green = staged (ready to commit)
- White = normal information

Useful shortcuts (macOS)

```
Cmd + S = Save in VS Code
Esc / :wq = Exit Vim
```
